                                                                                                                                                                                                                                                                                                                 New antisense compounds targeted to nucleic acids encoding RecQ protein-
like 4, useful for modulating expression of the nucleic acid and treating
diseases associated with expression of the nucleic acid in humans.
                                                                                                                                                                                                                                                                                                                                                                                                           The invention relates to a compound targeted to specific nucleobases of RecQ protein-like 4 (RECQL4) and which hybridises and inhibits the expression of RECQL4. The compound is useful for inhibiting the expression of RECQL4 in cells or tissues and for treating an animal, particularly a human suspected of having or being prone to a disease or condition associated with expression of RECQL4. The compound is useful for disgnostics, therapeutics and as a research reagent, e.g. prophylactically to prevent or delay infection, inflammation or tumour formation. This sequence represents an antisense oligonucleotide used in
Human; RecQ protein-like 4; RECQL4; ss; chromosome 8q24; infection; inflammation; tumour formation; cancer; cytostatic; antiinflammatory; antimicrobial; antisense therapy; antisense oligonucleotide.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Human interleukin-12 p35 subunit DNA amplifying forward PCR primer.

The present invention relates to novel antisense oligonucleotides which specifically hybridise with specific regions of nucleic acids encoding interleukin-12 (II-12) p35 subunit and inhibit the expression of human IL-12 p35 subunit and inhibit the expression of human IL-12 p35 subunit in human cells or tissues and for treating animals, particularly humans suspected of having or being prone to diseases or conditions associated with expression of IL-12 p35 subunit. They are useful for diagnostics, therapeutics and as research reagent, e.g. prophylactically to prevent or delay infection, tumour formation or inflammation. Sequences of the invention are useful for antisense therapy. The present DNA sequence is a PCR primer which is used for amplifying human IL-12 p35 subunit DNA. This sequence is used in the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Preparing lipopeptide synthetases, useful for producing new combinations of lipid molecules and amino acid modules, comprises modifying the lipid moiety and optionally a peptide moiety of one or more known (lipo) peptide
                                                                     Novel antisense compounds targeted to nucleic acids encoding interleukin-12 p35 subunit, useful for modulating interleukin-12 p35 subunit expression and treating diseases associated with expression of the subunit in humans.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Lipopeptide synthetase; multifunctional enzyme; lipid module; peptide module; DNA libzary; lipopeptide synthesis; antimicrobial; solid surface; immobilisation; ss.

                            The invention relates to a method of preparing novel lipopeptide synthetases by modifying the lipid module and optionally the peptide synthetases. The method involves providing a range of DNA fragments encoding lipopeptide synthetases. The method involves providing a range of DNA fragments encoding lipopeptide synthetase encoding lipopeptide synthetase non-palindromaic sticky ends; selecting and ligating at least two of these DNA fragments, at least one of which is specific for the lipid moiety of the lipopeptide synthetase encoding DNA molecule; introducing the lipopeptide synthetase-encoding DNA molecule; call; and expressing the DNA molecule in the host cell. The invention of cell; and expressing the DNA molecule in the host cell. The invention of cell; and method for non-ribosomal preparation of novel peptides synthetases constants and method for non-ribosomal preparation of novel peptides using the novel lipopeptide synthetases of the invention have a lipid constant and peptide module configuration that does not exist in nature, and the DNA library is useful in the production of a range of lipopeptide synthetases. The lipopeptide synthetases of the invention are useful for producing very large numbers of novel lipopeptides, which differ from existing lipopeptides in their fatty acid composition and optionally their amino acid composition. Such lipopeptides, which differ from existing lipopeptides in their fatty acid composition and optionally their and/or activities compared to known lipopeptides, which differ from existing lapopetides in their fatty acid composition and optionally their and/or activities compared to known lipopeptides may have novel structures and/or activities compared to known lipopeptides may have novel structures and/or activities compared to known lipopeptides may have novel structures cand/or activities compared to known lipopeptides sunder to permit the assembly of lipopeptide synthetase modules of containing an Sfil sticky and an Sfil sticky and an Sfil sticky and an Sfil sticky a
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ö

The method comprises determining whether the bacteria has a type 4 or R6 allele of the vex2 gene and pep27 genes, where vex2 and pep27 genes are closely associated with tolerance to penicillin and vancomycin, and the bacteria is determined to be likely to be tolerant if it has a type 4 allele of the vex2 gene and an R6 allele of the pep27. Also disclosed are PCR primers which can be used to
                                                                                                                                                 The invention relates to a novel method for determining racing potential of a horse. The method comprises measuring: whether grandpaternal DNA is over-represented in the genome of the horse; or in the case where one of the grandmothers was selected for breeding on the basis of racing performance, whether grandmaternal DNA from the selected grandmother is over-represented in the genome of the horse which indicates that the horse has good racing potential. The method of the invention is useful for determining the racing potential. The method of the invention is useful for determining the racing potential of a horse or for obtaining a progeny horse with good racing potential. This polynucleotide sequence represents a PCR primer used in the detection method of over-
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Identifying antibiotic tolerant bacteria, especially antibiotic tolerant Streptococcus pneumoniae, by determining whether the bacteria has type 4 or R6 allele of vex2 and pep27 gene.
Determining the racing potential of a horse comprises measuring whether grandpaternal or grandmaternal DNA from the selected grandmother DNA is over-represented in the genome of the horse.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    vex2; ss; PCR; primer; SNP; single nucleotide polymorphism;

amplify the regions of the vex2 and pep27 genes which contain the single nucleotide polymorphisms (SNPs). The genes are located within the vex/pep27/vncr/s operon encoding the major pneumocoocal autolyric enzyme, byth. The operon encodes for a signal peptide, Pep27 that is transported out of the cell via the vex dedicated transporter. Once it reaches a critical density in the supernatant, it signals through the two-component regulatory system, vncS and vncR, which subsequently induces activation of LytA. Mutations in any one of the operon genes prevents proper signaling, resulting in a lack of LytA activation and antibiotic signaling, resulting in a lack of LytA activation and antibiotic signaling whether a bacteria is colerance. The method is useful for determining whether a percent signaling and vancomycin and, therefore, for determining whether a subject suffering from a bacterial infection can be effectively treated with those antibiotics. The method is rapid and correctly predicts whether a subject can be successfully treated with a particular antibiotics can be succided as or that alternative therapies can be administered without delay. The sequence presented is the reverse pcR primer which was used to amplify the S. pneumoniae vncS SNP containing

The invention relates to novel transgenic animals expressing the high commass (HBM) gene, expressing the corresponding wild type HBM gene, comprising an alteration of the gene encoding LRPS or LRPG, or expressing an LRPS that is modulated by an altered gene control sequence introduced by homologous or non-homologous recombination. The transgenic animals are for the study of bone density modulation or bone mass modulation. The invention has osteopathic and cytostatic activity. The polymucleotides of the invention may have a use in gene therapy. The transgenic animals and concleic acids are for the study of bone density modulation, where the nucleic acids are for the study of bone density modulation, where the concleic acids are selected from bone density, bone strength, trabecular number, bone size, or bone tissue connectivity. The transgenic animals moduled and methods are useful for identifying molecules involved in bone development, and for developing pharmaceutical compositions, which may be employed for treating or preventing bone diseases, e.g. osteoporosis, osteomalacia, rickets, Paget's disease, or neoplasms of the bone. The transgenic animals and nucleic acids are also useful in methods for diagnosing diseases involved in bone development, or characterised by reduced bone density or mass. The present sequence is useful in the exemplification of the invention 0 ABZ80408 to ABZ80418 encode the human proteins ABP96551 to ABP96561 which have cancer inhibiting functions. Also described is a method for preparing the proteins using recombination techniques. The human proteins from the present invention, and nucleotide sequences encoding them, can be used for treating diseases such as cancer. The present sequence represents a PCR primer for a human cancer inhibiting function related protein from the present invention Human protein that suppresses cancer cell growth and its coding sequence.                                                                                                                           .
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The invention relates to a new pharmaceutical composition comprising: (a) an oligonucleotide sequence having up to 50 base pairs (bp); and (b) carboplatin and paclitearl, cisplatin and gencitabine, 5-fluorouracil and leucovorin, or docetaxel. The pharmaceutical composition is useful for treating diseases associated with protein kinase C such as hyperproliferative and inflammacory conditions e.g. psoriasis, tumours and cancer e.g. non-small cell lung cancer, non-Hodgkin's lymphoma, glioblastoma, bladder cancer, lung cancer, colon cancer, breast cancer, ovarian cancer and pancreatic cancer. The present sequence represents an
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       inflammation; psoriasis; cancer; non-small cell lung cancer; lung cancer; non-Hodgkin's lymphoma; glioblastoma; bladder cancer; colon cancer; breast cancer; ovarian cancer; pancreatic cancer.

The invention relates to a method of inhibiting growth of a microsatellite instability (MSI)-positive tumour, which involves introducing into the tumour a nucleic acid molecule encoding a retinoblastoma protein-interacting zinc finger gene (RIZ)-1 polypeptide and expressing the polypeptide in the tumour in an effective amount to inhibit growth of the tumour. The method is useful for inhibiting growth of a microsatellite instability (MSI)-positive tumour. The tumour contains cells having an abnormal number of adenosine nuclectides in a RIZ poly(A) tract. The MSI-positive tumour is colorectal tumour, gastric tumour, endometrial tumour or hereditary nonpolyposis colon carcinoma. Also disclosed is a method for determining MSI status of the tumour. Both methods are are useful for detecting and treating MSI(+) tumours and for inducing apoptotic cell killing both in vitro and in vivo. The present sequence represents the RIZ(A) & tract primer RIZA8-F
                                                                                                                                                                                                                                                                                                                                               RIZ1; microsatellite instability; tumour; apoptosis; ss; PCR; primer; retinoblastoma protein interacting zinc finger gene; colorectal tumour; endometrial tumour; hereditary nonpolyposis colon carcinoma; MSI;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Inhibiting growth of microsatellite instability-positive tumor, by introducing a nucleic acid molecule encoding a retinoblastoma protein-interacting zinc finger gene-1 polypeptide into the tumor.

This invention relates to novel chimeric antisense oligonucleotides that specifically hybridise to and inhibit the expression of the nucleotide binding oligonucleotide domain 1, NOD1 protein. NOD1, also known as CARD4 (caspase associated recruitment domain 4) is a domain that is involved in the elimination of cells via programmed cell death and in the host defence against pathogens, i.e. it works to regulate apoptosis. Apoptosis of a naturally occurring process, however, if it becomes overstimulated it can lead to cell loss and neurodegenerative conditions including cli can lead to cell loss and neurodegenerative conditions including programments and blood cell disorders. Conversely, insufficient apoptosis con contribute to the development of cancer, autoimmune disorders and contribute to the development of cancer, autoimmune disorders and contribute to the development of cancer, autoimmune disorders and coligonucleotides that can modulate NOD1 expression and variants there can modulate NOD1 expression fand variants cheat various human diseases caused by aberrant apoptosis. This oligonucleotide sequence is the chimeric antisense oligo used to inhibit expression of human NOD1, the aim of the invention. Note that it has two certain and its procession of human NOD1, the aim of the invention. Note that it has two certain and procession of human NOD1, the aim of the invention. Note that it has two certain and procession of human NoD1, the alm of the invention is phosphorothicate the chimerical procession of the oligonucleotide backbone is phosphorothicate.
Antisense; nucleotide binding oligonucleotide domain 1; gene therapy; ss; caspase associated recruitment domain 4; programmed cell death; cancer; apoptosis; Alzheimer's; neurodegenerative; Parkinson's; ALS; NOD1; CARD4; amyotrophic lateral selerosis; retinitis pigmentosa; autoimmune disorder; viral infection; human; chimeric.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   New compound, comprising a sequence targeted to a nucleic acid encoding nucleotide-binding oligomerization domain 1 (NOD1), useful for preparing a composition for treating hyperproliferative disease, e.g., cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Sequence tagged site #244 used to prepare Zmax1 (LRP5) gene region map.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Osteopathic, Gene therapy; High Bone Mass; HBM; LRP5; Zmax1; LRP6; bone mass modulation; osteoporosis; STS; sequence tagged site; ds.

The present invention relates to High Bone Mass (HBM), LRP5 (Zmax1) and LRP6 mutants, which results in a HBM-like phenotype when expressed in a cell. The HBM-like phenotype results in bone mass modulation and/or lipid level modulation. The invention is useful for diagnoshing a HBM-like phenotype in a subject and for preparing a composition for modulating bone mass and/or lipid levels in a subject suffering from e.g. osteoporosis. The present sequence is a Sequence Tagged Site (STS) marker, which was used to prepare a physical map of the Zmax1 (LRPS) gene
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  single nucleotide polymorphism; SNP; fish; Salmo salar;
Orechromis niloticus; Atlantic halibut; microsatellite; cod;
polymorphic site; seabass; salmonidae; Tilapia; rainbow trout; halibut;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            New nucleic acid comprising a mutation in LRP5 or LRP6, useful for diagnosing a HBM-like phenotype in a subject and for preparing a composition for modulating bone mass and/or lipid levels in a subject
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Gaps

The present invention describes an isolated nucleic acid (I) comprising a single nucleotide polymorphism (SNP) chosen from: (i) a nucleic acid of salmo salar SNPs, Orecohromis niloticus SNPs or Atlantic halibut SNPs; and (ii) a nucleic acid having nuclectide sequence that hybridises to cand it is nucleic acid having nuclectide sequence that hybridises to comprisions to its complement under highly stringent hybridisation conditions. The described: (i) an isolated oligonucleotide (II) comprising at least of an ucleotide sequence of S. salar SNPs, O. niloticus SNPs, O. niloticus microsatellites, Atlantic halibut SNPs, cod polymorphic sites and seabass polymorphic sites, or their complement; (2) a primer pair (III) suitable for use in PCR, comprising two (II) capable of amplifying a nucleotide sequence chosen from S. salar SNPs and, O. colloticus SNPs, O. niloticus microsatellites, Atlantic halibut SNPs, cod polymorphic sites and seabass polymorphic sites; and determining (MI) the comprising a parentage genotype database comprising providing a parentage genotype database comprising a parentage genotype to the parentage genotypes; where each of the sample genotype to the parentage genotype database, where a match between the sample genotype and one of the candidate parent genotype identifies configuration of the sample senotype and one of the candidate parent genotype identifies a fish sample such as family salmonidae, S. salar, Tilapia, O. niloticus, rainbow trout, halibut, seabass and Atlantic cod. (II) is useful for carinbow trout, halibut, seabass and Atlantic cod. (II) is useful for candidate parent genotype contacting the sample containing nucleic acid that hybridises to salar SNPs and identifying nucleic acid that hybridises to salar SNPs and identifying nucleic acid that hybridises to salar sNPs and identifying a parentage genoted to salar sNPs and of the sample solar acid that hybridises to salar sNPs and identifying the sample acid molecule configuration acid that hybridises to salar sNPs and identifying t
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                microsatellite, O. niloticus SNPs, Atlantic halibut SNPs, cod polymorphic sites is seabass polymorphic sites, and identifying a nucleic acid that hybridises to (II). (III) is useful for detecting nucleic acid molecule comprising a microsatellite sequence in sample. The present sequence is
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 useful for detecting nucleic acid molecule comprising a polymorphic sequence in a sample, comprising contacting the sample containing nucleic acids with one or more (II) which is derived from O. niloticus
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Novel isolated nucleic acid molecule comprising single nucleotide polymorphism associated with fish, useful for forming PCR primers which are used for detecting single nucleotide polymorphisms in fish nucleic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      used in the exemplification of the present invention

S. pneumoniae vncS gene PCR primer #2.

(first entry)

29-JAN-2004

Determining predisposition to inverted nipples useful e.g. for selecting breeding animals comprises detecting specific microsatellite markers.

where the nucleic acid is identical to the region of microsatalites \$80200, \$87443, \$50097, \$80007, \$811301 or \$50164 on chromosomes 6, 2, 4, 14, 1 and 3, respectively, in pigs, or homologous positions in the genomes of other mammals. The nucleic acids can be used to select pets, breeding or farm animals that lack inverted nipples, particularly by genomic arcenting of many related mammals in a population. The present sequence is a PCR primer used in the exemplification of the invention to identify microsatellite markers associated with the inverted nipple phenotype predisposition of appearance or inheritance of inverted nipples, 88888888888888

Pharmaceutical composition for treating allments associated with impaired respiration, has oligo(s) antisense to specific gene(s) or its corresponding RNAs, and glucocorticoid or non-glucocorticoid steroid or ubiquinone

Disclosure; SEQ ID NO 6547; 872pp; English.

The invention relates to a novel pharmaceutical composition, which has a first active agent comprising an oligonucleotide antisense to the initiation codon, coding region, 5 or 3 end genomic flanking regions, 5 and 3' intron-exon junctions, or regions within 2-10 nucleotides of junctions of genes encoding a polypeptide associated with lung and/or masal airway dysfunction and a second active agent comprising an antinflammatory steroid and ubiquinone. A composition of the invention has antinflammatory, antiallergic, antiasthmatic, hypotensive, immunosuppressive, and cytostatic activity. The composition may have use in antisense gene therapy. The composition is useful for treating or preventing a respiratory, lung or malignant disease or condition, also

antiinflammatory steroid in a subject, for reducing or depleting levels of, or reducing sensitivity to adenosine, reducing levels of adenosine receptor, producing bronchodilation, increasing levels of ubiquinone or lung surfactant in a subject's tissue, or treating bronchoconstriction, lung inflammation, lung allergies, or a respiratory disease or condition. Note: The sequence data for this patent is not represented in the printed specification, but was obtained in electronic format directly from WIPO enhancing the prophylactic or therapeutic respiratory effect at ftp.wipo.int/pub/published\_pct\_sequences

WPI; 2003-229219/22.

Pharmaceutical composition for treating ailments associated with impaired respiration, has oligo(s) antisense to specific gene(s) or its corresponding RNAs, and glucocorticoid or non-glucocorticoid steroid or ubiquinone.

Disclosure; SEQ ID NO 3982; 872pp; English.

The invention relates to a novel pharmaceutical composition, which has a first active agent comprising an oligonuclectide antisense to the initiation codon, coding region, 5' or 3' end genomic flanking regions, 5' and 3' intron-exon junctions, or regions within 2-10 nucleotides of junctions of genes encoding a polypeptide associated with lung and/or ansal alraway dystunction and a second active agent comprising an antiinflammatory steroid and ubiquinone. A composition of the invention has antiinflammatory, antiallergic, antiasthmatic, hypotensive, immunosuppressive, and cytostatic activity. The composition may have a use in antisense gene therapy. The composition is useful for treating or preventing a respiratory, lung or malignant disease or condition, also

The present invention describes a new isolated nucleic acid sequence (I) comprising a DPP10 mRNA sequence. DPP10 is a dipeptidyl peptidase (also known as prolyloligopeptidase). (I) has antinflammatory, antiasthmatic, antiasthmatic, antiasthmatic, antiastrhritic and antirheumatic activities, and can be used in vaccines and gene therapy. A composition comprising (I) can be used for the manufacture of a medicament for regulating DPP10 expression or for preventing or treating inflammatory disease e.g., inflammatory bowel disease, asthma, atopy, rheumatoid arthritis or psoriasis. (I) can also be used in an assay for detecting or measuring DPP10 in a sample. A

host cell comprising (I) can be used for producing recombinant DPP10 gene products, or in drug screening systems to identify agents for diagnosis or treatment of individuals having or susceptible to inflammatory disease. Human DPP10 is located on chromosome 2, more specifically chromosome 2914. ABQ84254 to ABQ84612 and ABP5569 to ABP5569 represent sequences used in the exemplification of the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     with the

                                                                                                                                                                                             ò
```

The present invention describes a compound (I) that is 8-50 nucleobases

```
in length targeted to a nucleic acid molecule encoding human stearoyl-CoA desaturase, and which specifically hybridises with and inhibits the expression of human stearoyl-CoA desaturase, or which specifically convicts a specifically hybridises with at least an 8-nucleobase portion of an active site on another acid molecule encoding human stearoyl-CoA desaturase. Human cardiovascular, antiarteriosclerotic, cytostatic and antiinflammatory activities, and can be used in antisense therapy. The antisense compounds (1) can be used for modulating the expression of human stearoyl-CoA desaturase and for treating diseases or conditions associated with expression of human stearoyl-CoA desaturase, e.g. abnormal lipid or cholesterol metabolism, atherosclerosis, or cardiovascular diseases. The antisense compounds (1) can also be used for diagnostics, therapeutics and prophylaxis, e.g. to prevent or cally infection, inflammation or tumour formation, as research reagents and kits, and in distinguishing between functions of various members of a biological pathway. The present sequence represents a human stearoyl-CoA desaturase inhibiting chimeric phosphorothioate antisense oligonucleotide, which is given in an example component in the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                             ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  (I) is useful for producing antidotes. Also disclosed are a recombinant vector containing the coding sequence for (I); a transformant transformed by the recombinant vector; and a method for preparing cytochrome P450, comprising culturing the transformant and recovering cytochrome P450 from the culture. The present sequence is a PCR primer, which was used in an example from the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The present invention relates to a novel cytochrome P450 (see ABP70653)
                                                                                                                                                                                                                                                                                                                                                                                                                                                               Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    A new polypeptide with cytochrome P450 activity useful for producing antidotes.
                                                                                                                                                                                                                                                                                                                                                                                                                                                             .

The invention describes a method of diagnosing a cellular proliferative disorder of breast tissue in a subject comprising determining the state of methylation of one or more nucleic acid isolated from the subject, where the state of methylation of one or more nucleic acids is compared with the state of methylation of one or more nucleic acids from a subject on having the cellular proliferative disorder of breast tissue. Also proliferative disorder of breast tissue, and a captular proliferative disorder of breast tissue in a subject; and a kit for the detecting a cellular proliferative disorder of breast tissue in a cellular proliferative disorder of breast tissue in a cellular proliferative disorder of breast tissue in a subject. The method is useful for diagnosing a cellular proliferative disorder of breast tissue in a subject. The method is useful for diagnosing a cellular proliferative disorder of breast tissue in a subject. The method is useful for diagnosing a cellular proliferative disorder of breast tissue in a subject. The method is useful for diagnosing a cellular proliferative disorder of breast tissue in a subject. The method is useful for diagnosing a cellular proliferative disorder of breast tissue in a subject. The method is useful for diagnosing a cellular proliferative disorder of breast tissue in a subject for primer used in the analysis of the methylation state of the serine protease NES-1 gene CpG islands in normal mammary epithelium, breast cancer cell lines and in

```
disorder of breast tissue in a subject comprising determining the state of methylation of one or more nucleic acid isolated from the subject, where the state of methylation of one or more nucleic acids is compared with the state of methylation of one or more nucleic acids from a subject not having the cellular proliferative disorder of breast tissue. Also described are: a method for determining a predisposition to a cellular proliferative disorder of breast tissue in a subject; and a kit for the detecting a cellular proliferative disorder of breast tissue in a subject; and a kit for the detecting a cellular proliferative disorder of breast tissue in a subject. The method is useful for diagnosing a cellular proliferative disorder of breast tissue in a subject. This sequence represents a methylation specific primer used in the analysis of the methylation state of the servine protease NES-1 gene Ogislands in normal mammary epithelium, breast cancer cell lines and in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The invention describes a method of diagnosing a cellular proliferative

The invention describes a novel composition, all at like active agent, comprising oligonucleotides, effective for alleviating bronchoconstriction, respiratory tract inflammation, allergies and bronchoconstriction, respiratory tract inflammation, allergies and creducing adenosine sensitivity, levels of adenosine (A) or (A) receptors, creducing adenosine sensitivity, levels of adenosine (A) or (A) receptors, congrated associated with lung airway or lung dysfunction or cancer and can be anti-sense to the corresponding mRNA. The invention also describes a kit, that comprises: (a) a delivery of device, in separate containers, (b) the oligomucleotides, (c) restructions for adding a carrier and for use of the kit. The composition of the invention has antiallargic, antiinflammatory, antiasthmatic, analgesic, hypotensive, immunosuppressive and cytostatic activity, is a beta-adrenergic agonist. The composition is useful for preventing or treating a respiratory, lung or malignant disease. The administered containing or treating a respiratory, lung or malignant disease. The administered containing or reduce the amount of target polypeptide present in the lungs. The pulmonary obstruction, and/or bronchoconstriction and/or lung confidence the amount of target polypeptide present in the lungs. The chilammation, allergies and/or surfactant hypoproduction are associated with a disease or condition such as pulmonary vasoconstriction, inflammation, allergies, asthma, impeded respiration, respiratory transplantation rejection, pulmonary infections, bronchitis or cancer transplantation rejection, pulmonary infections, bronchiting present in the target RNA serves to prevent the breakdown o

This invention describes a novel composition (a) a first active agent, comprising oligonucleotides, effective for alleviating comprising oligonucleotides, effective for alleviating bronchoconstriction, respiratory tract inflammation, allergies and reducing adenosine sensitivity, levels of adenosine (A) or (A) receptors, curfactant depletion or hyposecretion, when administered to a mammal. The cigonucleotides are derived from a gene encoding or regulating cyreaprassion of a target polypeptide associated with lung airway or lung dysfunction also describes a kit, that comprises: (a) a delivery of the invention also describes a kit, that comprises: (a) a delivery constructions for adding a carrier and for use of the kit. The composition of the invention has antiallergic, antiinflammatory, antiasthmatic, analgesic, hypotensive, immunosuppressive and cytostatic activity, is a confosition comprises oligo and is administered to reduce the production or availability, or to increase the degradation of the target mRNA or to

ö inflammation, allergies, asthma, impeded respiration, respiratory distress syndrome, pain, cystic fibrosis, allergic rhinitis, pulmonary hypertension, emphysema, chronic obstructive pulmonary disease, pulmonary transplantation rejection, pulmonary infections, bronchitis or cancer. The reduced adenosine content of the anti-sense oligos corresponding to thymidines present in the target RNA serves to prevent the breakdown of the oligonucleotides into products that free adenosine into the system e.g., lung, brain, heart, kidney, etc, tissue environment and thereby, to prevent any unwanted effects due to it Human; antisense; bronchoconstriction; allergy; hyposecretion; pain; respiratory tract inflammation; adenosine sensitivity; lung; cancer; surfactant depletion; antiallergic; antiinflammatory; antiasthmatic; analgesic; hypotensive; immunosuppressive; cytostatic; cystic fibrosis; beta-adrenergic agonist; respiratory disease; pulmonary vasoconstriction; respiratory distresses syndrome; allergic rhinitis; pulmonary hypertension; emphysema; chronic obstructive pulmonary disease; cancer; bronchitis; pulmonary transplantation rejection; ss; primer. comprising oligonucleotides, effective for alleviating bronchoconstriction, respiratory tract inflammation, allergies and reducing adenosine sensitivity, levels of adenosine (A) or (A) receptors, surfactant depletion or hyposecretion, when administered to a mammal. The pulmonary obstruction, and/or bronchoconstriction and/or lung inflammation, allergies and/or surfactant hypoproduction are associated with a disease or condition such as pulmonary vasoconstriction, This invention describes a novel composition (a) a first active agent, Gaps Pharmaceutical composition for treating asthma, has antisense oligonucleotide containing less percentage of adenosine, targeted trucleic acids associated with lung airway or lung dysfunction, and reduce the amount of target polypeptide present in the lungs. cutyonnotectures are certived from a gene encouring or regulating cyression of a target polypeptide associated with lung airway or lung dysfunction or cancer and can be anti-sense to the corresponding mRNA.

The invention also describes a kit, that comprises: (a) a delivery device, in separate containers (b) the oligonuclectides, (c) instructions for adding a carrier and for use of the kit. The composition of the invention has antiallargic, antiinflammatory, antiasthmatic, analgesic, hypotensive, immunosuppressive and cytostatic activity, is a beta-adrenergic agonist. The composition is useful for preventing or treating a respiratory, lung or malignant disease. The administered composition comprises oligo and is administered to reduce the production or availability, or to increase the degradation of the target mRNA or to raduce the amount of target polypeptide present in the lungs. The pulmonary obstruction, and/or bronchoconstriction and/or lung inflammation, allergies and/or bronchoconstriction and/or lung distress or condition such as pulmonary vasoconstriction, and sease or conditions with a submanary disease, pulmonary contension, emphysema, chronic obstructive pulmonary disease, pulmonary transplantation rejection, pulmonary impeded respiration, respiratory transplantation rejection, pulmonary infections, bronchitis or cancer. The reduced adenosine content of the anti-sense oligos corresponding to the oligonucleotides into products that free adenosine into the system c., lung, brain, heart, kidney, etc, tissue environment and thereby, to prevent any unwanted effects due to it ö cytostatic; protein-kinase-inhibitor-C-alpha; gene therapy; carboplatin; paclitaxel; docetaxel; cisplatin; gemcitabine; 5-fluorouracil; leucovorin; procein kinase C alpha inhibitor; PKC-alpha inhibitor; cancer; non-small cell lung cancer; non-Hodgkin's lymphoma; antisense technology; ss; PKC-epsilon. Gaps oligonucleotides are derived from a gene encoding or regulating ö Protein kinase C epsilon antisense oligonucleotide seq id 86 1.3%; Score 14.2; DB 1; Length 20; 84.2%; Pred. Also described are: a method of inhibiting protein kinase C (PKC)-alpha expression in human cells by contacting the cells with any of the pharmaceutical compositions; and methods of treating a condition associated with expression of human PKC-alpha by administering to an animal, or its cells, tissues or bodily fluid any of the pharmaceutical compositions are useful for inhibiting PKC-alpha expression in human cells. The compositions are useful for treating a condition associated with the expression of human PKC-alpha, particularly cancer. In particular, the compositions are useful for treating an condition associated with the expression of human PKC-alpha, particularly cancer. In particular, the compositions are useful for treating on-small lung cancer or non-Hodgkin's lymphoma in a human. This sequence
New pharmaceutical compositions comprising oligonucleotide in combination with e.g. arboplatin or cisplatin, useful for inhibiting protein kinase C expression, particularly for treating cancer, e.g. non-Hodgkin's
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The invention comprises antisense oligonucleotides that are targeted to CDC-like kinase 1. The antisense oligonucleotides of the invention are
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           New antisense oligonucleotides targeted to nucleic acid molecules encoding CDC-like kinase 1, useful for treating diseases or conditions associated with expression of CDC-like kinase 1, e.g. cancers or autoimmune disorders.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      antisense oligomucleotide; CDC-like kinase 1; cancer; autoimmune disorder; infection; inflammation; tumour formation; human; ss; 2'-O-methoxyethyl gapmer; phosphorothioate backbone.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Gaps

ö ö The invention comprises antisense oligonucleotides that are targeted to CDC-1ike kinase 1. The antisense oligonucleotides of the invention are useful for modulating the expression of CDC-1ike kinase 1, and for treating diseases or conditions associated with expression of CDC-like kinase 1 (e.g. cancers and autoimmune disorders). The antisense oligonucleotides may also be used to prevent or delay infection, inflammation and tumour formation. The present DNA sequence represents an antisense oligonucleotide of the invention that is targeted to human CDC-like kinase 1. NOTE: The present sequence is a 2'-0-methoxyethyl gapmer with a phosphorothioate backbone. treating diseases or conditions associated with expression of CDC-like kinase 1 (e.g. cancers and autoimmune disorders). The antisense oligonuclectides may also be used to prevent or delay infection, inflammation and tumour formation. The present DNA sequence represents an antisense oligonuclectide of the invention that is targeted to human CDC-like kinase 1. NOTE: The present sequence is a 2'-O-methoxyethyl gapmer with a phosphorothioate backbone. New antisense oligonucleotides targeted to nucleic acid molecules encoding CDC-like kinase 1, useful for treating diseases or conditions associated with expression of CDC-like kinase 1, e.g. cancers or antisense oligonucleotide; CDC-like kinase 1; cancer; autoimmune disorder; infection; inflammation; tumour formation; human; ss; 2'-O-methoxyethyl gapmer; phosphorothioate backbone.                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The invention comprises an antisense oligonucleotides that are targeted to nucleic acids encoding a mammalian glucocorticoid receptor. The antisense oligonucleotides of the invention are useful for preventing or delaying infection, inflammation or tumour formation. The antisense oligonucleotides are also useful for treating diabetes, obesity, cardiovascular disorders, hyperlipidaemia or Cushing's syndrome. The present DNA sequence represents an antisense oligonucleotide that targets
                                                                                                                                                                                                                                                                                                                                                                                                           New antisense compound targeted to a nucleic acid molecule encoding mammalian glucocorticoid receptor, useful for treating diabetes, obesity, cardiovascular disorder, hyperlipidemia or Cushing's syndrome.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        the human glucocorticoid receptor gene. NOTE: The present sequence contains 2'-methoxyethyl (2'-MOE) wings and a phosphorothioate backbone.

The antisense oligonuclectides of the invention are useful for preventing or delaying infection, inflammation or tumour formation. The antisense oligonuclectides are also useful for treating diabetes, obesity, cardiovascular disorders, hyperlipidaemia or Cushing's syndrome. The present DNA sequence represents an antisense oligonuclectide that targets the human glucocorticoid receptor gene. NOTE: The present sequence contains 2'-methoxyethyl (2'-MOE) wings and a phosphorothioate backbone.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       New antisense compound targeted to a nucleic acid molecule encoding mammalian glucocorticoid receptor, useful for treating diabetes, obesity, cardiovascular disorder, hyperlipidemia or Cushing's syndrome.
antisense oligonucleotide; glucocorticoid receptor; infection; infalmalton; tumour formation; diabetes; obesity; cardiovascular disorder; hyperlipidaemia; Cushing's syndrome; human; ss; phosphorothioate backbone; 2'-methoxyethy1; 2'-MOB.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            antisense oligonucleotide; glucocorticoid receptor; infection; inflammation; tumour formation; diabetes; obesity; cardiovascular disorder; hyperlipidaemia; Cushing's syndrome; human; ss; phosphorothioate backbone; 2'-methoxyethyl; 2'-MOE.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The invention comprises an antisense oligonucleotides that are targeted
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Human glucocorticoid receptor-specific antisense oligonucleotide

to nucleic acids encoding a mammalian glucocorticoid receptor. The antienne coligonucleotides of the invention are useful for preventing or delaying infection, inflammation or tumour formation. The antisense oligonucleotides are also useful for treating diabetes, obesity, cardiovascular disorders, hyperlipidaemia or Cushing's syndrome. The present DNA sequence repersents an antisense oligonucleotide that targets the human glucocorticoid receptor gene. NOTE: The present sequence contains 2'-methoxyethyl (2'-MOE) wings and a phosphorothioate backbone.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              New antisense compound targeted to a nucleic acid molecule encoding mammalian glucocorticoid receptor, useful for treating diabetes, obesity, cardiovascular disorder, hyperlipidemia or Cushing's syndrome.
                                                                                                              New antisense compound targeted to a nucleic acid molecule encoding mammalian glucocorticoid receptor, useful for treating diabetes, obesity, cardiovascular disorder, hyperlipidemia or Cushing's syndrome.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           antisense oligonucleotide; glucocorticoid receptor; infection; inflammation; tumour formation; diabetes; obesity; cardiovascular disorder; hyperlipidaemia; Cushing's syndrome; human; ss; phosphorothioate backbone; 2'-methoxyethyl; 2'-MOE.
                                                                                                                                                                                                                    The invention comprises an antisense oligonucleotides that are targeted
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Human glucocorticoid receptor-specific antisense oligonucleotide #1477.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The invention comprises an antisense oligonucleotides that are to nucleic acids encoding a mammalian glucocorticoid receptor.
                                                                                                                                                                                                                                                                                                                                                                                                                              Length 20;
                                                                                                                                                                                                                                                                                                                                                                                               Sequence 20 BP; 6 A; 5 C; 5 G; 4 T; 0 U; 0 Other;

The invention comprises an antisense oligonucleotides that are targeted to nucleic acids encoding a mammalian glucocorticoid receptor. The antisense oligonucleotides of the invention are useful for preventing or delaying infection, inflammation or tumour formation. The antisense oligonucleotides are also useful for treating diabetes, obesity, cardiovascular disorders, hyperlipidaemia or Cushing's syndrome. The present DNA sequence represents an antisense oligonucleotide that targets the human glucocorticoid receptor gene. NOTE: The present sequence contains 2'-methoxyethyl (2'-MOE) wings and a phosphorothioate backbone.
                                                                                                                                                                                                                               ö

The invention comprises an antisense oligonucleotides that are targeted antisense oligonucleotides of the invention are useful for preventing or delaying infection, inflammation or unour formation. The antisense oligonucleotides are also useful for treating diabetes, obesity, cardiovascular disorders, hyperlipidaemia or Cushing's syndrome. The present DNA sequence represents an antisense oligonucleotide that targets the human glucocorticoid receptor gene. NOTE: The present sequence contains 2'-methoxyethyl (2'-MOE) wings and a phosphorothioate backbone.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     New antisense compound targeted to a nucleic acid molecule encoding mammalian glucocorticoid receptor, useful for treating diabetes, obesity, cardiovascular disorder, hyperlipidemia or Cushing's syndrome.
                                                                                                                                                                                                    Human glucocorticoid receptor-specific antisense oligonucleotide #1849.
                                                                                                                                                                                                                             antisense oligonucleotide; glucocorticoid receptor; infection; inflammation; tumour formation; diabetes; obesity; cardiovascular disorder; hyperlipidaemia; Cushing's syndrome; human; phosphorothioate backbone; 2'-methoxyethyl; 2'-MOE.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Human HMG-CoA reductase antisense oligonucleotide, SEQ ID No 111

The novel compounds have cardiant, antiarteriosclerotic, and antilipaemic activities. The compound can be used to treat disorders by antisense gene therapy. The compounds compositions and methods are useful for treating a disease or condition associated with HMG-COA reductase, such as a cardiovascular disorder e.g. atherosclerosis, or a disease or condition involving cholesterol metabolism. They are also useful in research and disagnostics for modulating the expression of HMG-COA reductase. This polymucleotide sequence represents an antisense oligonucleotide of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         HMG-CoA reductase; 3-hydroxy-3-methylglutaryl-Coenzyme A;

                                                                                                                                                                                                                                                                                                                                                                                                                    ò
                                                                                                                                                                                                                                                                                                                                                  엄
                                                                                                                                                                                                                                                                                                                                                                                               ö
                                                                                                                                                                                     The invention relates to novel compounds of 8-80 nucleobases in length targeted to, and which specifically hybridises with, a nucleic acid molecule encoding 3-hydroxy-3-methylglutary1-Comaryme A (HMG-COA) reductase, and inhibits the expression of HMG-COA reductase. The novel compounds have cardiant, antiarteriosclerotic, and antilipaemic activities. The compound can be used to treat disorders by antisense gene therapy. The compound can be used to treat disorders by antisense gene therapy. The compounds associated with HMG-COA reductase, such as a disease or condition associated with HMG-COA reductase, such as a cardiovascular disorder e.g. atherosclerosis, or a disease or condition involving cholesterol metabolism. They are also useful in research and diagnostics for modulating the expression of HMG-COA reductase. This polynucleotide sequence represents an antisense oligonucleotide of the

                                                                                                                                                                                                                                                                                                                                  This invention relates to a novel method of identifying the presence or absence of a genetic marker in the human cystic fibrosis transmembrane conductance regulator (CFTR) gene of a subject using a PCR assay. The method comprises providing at DNA sample from the subject, providing at least one primer set given in the specification, contacting the DNA and the primer set that comprises a region of DNA that includes the location of primer set that comprises a region of DNA that includes the location of the genetic marker, separating the extension product on the basis of melting behaviour and identifying the presence or absence of the genetic marker in the subject by analysing the melting behaviour of the extension product. The present sequence is that of a PCR primer which was used in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Novel single or multiple target oligonucleotide anti-sense to e.g. initiation codons and introns of respiratory disease-relevant genes e.g., CCRI, RANTES, MCP4, useful for prophylaxis or treating respiratory
                                                                                                                           Identifying the presence or absence of a genetic marker in the human cystic fibrosis transmembrane conductance regulator gene of a subject by contacting the DNA and primer set and separating the extension product.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           interleukin; IL-4 receptor; IL-5 receptor; lung disease; airway inflammation; allergy; asthma; impeded respiration; cystic fibrosis; acute respiratory distress syndrome; pulmonary hypertension; lung inflammation; bronchitis; oligonucleotide;

The present invention relates to an oligonuclectide anti-sense to e.g., initiation codon, coding region with 2-10 nuclectides of 5'-end and 3'-end of nucleic acid target comprising gene(8) chosen from e.g. interleukin (IL)-4 receptor, IL-5 receptor or salts of the cligonuclectide and optionally surfactant operatively linked to the cligonuclectide. The method is useful for preventing or treating a respiratory or lung disease, which involves administering to the airways of a subject an effective amount of an inhibitor. The oligonuclectide is useful for production of a medicament for the prevention and/or treatment of a respiratory or lung disease. The respiratory or lung disease is chosen from airway inflammation, allergy(ies), asthma, impeded respiratory criticities (RP), chronic obstructive pulmonary diseases (CP), chronic obstructive pulmonary diseases (CPD), allergic rhinitis (AR), acute respiratory distress syndrome (ARDS), pullmonary hypertension, lung inflammation, bronchitis, airway continuation. The present sequence represents an oligonucleotide of the

The present invention relates to an oligonucleotide anti-sense to e.g., intitation codon, coding region with 2-10 nucleotides of 5'-end and 3'-end of nucleic acid target comprising gene(8) chosen from e.g. interleukin (IL)-4 receptor, IL-5 receptor or salts of the

oligonucleotide and optionally surfactant operatively linked to the oligonucleotide. The method is useful for preventing or treating a respiratory or lung disease, which involves administering to the airways of a subject an effective amount of an inhibitor. The oligonucleotide is useful for production of a medicament for the prevention and/or treatment of a respiratory or lung disease. The respiratory or lung disease is chosen from airway inflammation, allergy(ies), asthma, impeded respiration, cystic fibrosis (CF), chronic obstructive pulmonary diseases (COPD), allergic rhinitis (AR), acute respiratory distress syndrome (ARDS), pulmonary hypertension, lung inflammation, bronchitis, airway
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The invention relates to a novel compound 8-80 nucleobases in length targeted to a nucleic acid molecule encoding integrin beta 5 (Itgb5). The compound specifically hybridises with the nucleic acid molecule encoding integrin beta 5, thus inhibiting the expression of integrin beta 5. The compound of the invention demonstrates cytostatic, antiinflammatory and antimicrobial activities and may be useful for inhibiting the expression of integrin beta 5, via antiseanse gene therapy and thus for treating diseases associated with expression of integrin beta 5, via antiseanse gene therapy and thus for treating diseases associated with as cancer, inflammation or infection. The current sequence is that of an antiseanse 2-MOB (2'-methoxyethyl) gapmer oligo targeted to human Itgb5 of the invention. The
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      New antisense compounds targeted to nucleic acid molecules encoding integrin beta 5, useful for treating diseases associated with expression of integrin beta 5, e.g. hyperproliferative disorder, infection or
                                                                                                                                                                                                                  obstruction. The present sequence represents an oligonucleotide of the

                                                                                                                                                                                                                                                                                                                                                                                                                                       /note= "OTHER= 2' methoxyethyl (2' MOE) nucleotides. All cytidine nucleobases are 5-methylcytidine."
oligonuclectide has central "gap" region flanked on both sides by 2-MOE "wings". The backbone linkages are phosphorothioate and all cytidine residues are 5-methylcytidines.
                                                                                                                                                                                                                              Antisense DNA oligo used to modulate human LRH1 expression SeqID 3340.

the expression of liver related homologue-1 (LRH1) and splice variants thereof. Specifically, it refers to compositions 8-30 nucleobases in length that target a portion of an active site on the nucleic acid molecule encoding LRH1 (also known as NRSA2). LRH1 is a monomeric orphan nuclear receptor protein that functions as a tissue specific ranscription factor. The present invention describes antisense oligonucleotides that comprise at least one modified internucleoside linkage, a phosphorothioate linkage, at least one modified sugar moiety, a 2'-0-methoxyethyl (2' MOE) and at least one modified sugar moiety, a 2'-0-methoxyethyl (2' MOE) and at least one modified sugar moiety, a 2'-0-methoxyethyl (2' MOE) and at least one modified sugar moiety, dyslipidaemia, atherosclerosis, low HDL (high density lipoprotein), high crid lipoprotein), hypercholesterolaemia, gall stones, triglyceridaemia, obesity, hepatitis B virus-mediated acute or chronic hepatitis, as well as hepatocellular carcinoma or a condition associated with excmatase activity. Accordingly, these compositions exhibit cytostatic, antiliflammatory and virucidal activities. This liboprotein, beand virucidal activities. This consequence is an antisense DNA oligo used to modulate the consequence.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            /mod_base= OTHER /note= "OTHER 2' methoxyethyl (2' MOE) nucleotides.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ሯ
                                                                                                                                                                                                                                                                                 This invention relates to novel antisense compounds useful for modulating the expression of liver related homologue-1 (LRH1) and splice variants thereof. Specifically, it refers to compositions 8-30 nucleobases in length that target a portion of an active site on the nucleic acid molecule encoding LRH1 (also known as NR5A2). LRH1 is a monomeric orphan nuclear receptor protein that functions as a tissue specific ranscription factor. The present invention describes antisense oligonucleotides that comprise at least one modified internucleoside linkage, a phosphorothioate linkage; at least one modified sugar moiety, a 2'-O-methoxyethyll 2' MOS) and at least one modified sugar moiety, a 2'-O-methoxyethyll 2' MOS) and at least one modified sugar moiety, a sethoxyethyll 2' MOS) and at least one modified nucleobase, a 5-methylcytidine. These antisense compounds are useful for treating of algensing a disease associated with LRH1, such as breast cancer, dysliptdeemia, atheroselerosis, low HDL (high density lipoprotein), high LDL (low density lipoprotein), hypercholesterolaemia, gall stone, triglyceridaemia, obesity, hepaticis B virus-mediated acute or chronic hepatitis, as well as hepatocellular carcinoma or a condition associated cycostatic, antilipaemic, antiarterioselerotic, anorectic, hepatorropic, litopolytic, antilipaemic, antiartenioselerotic, anorectic, hepatorropic, litopolytic, antilipaemic, antiartenioselerotic, anorectic, hepatorropic, litopolytic, antilipaemic and virus and viru
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ö
                                                                                                                                                                             New antisense oligonucleotides targeted to a nucleic acid encoding liver related homologue-1 (LRH1), useful for treating breast cancer, dyslipidemia, atherosclerosis, hypercholesterolemia, or hepatitis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              human; ss; liver related homologue-1; LRH1; NR5A2; antisense; phosphorothioate; 2' MOE; breast cancer; dyslipidaemia; atherosclerosis; low HDL; high density lipoprotein; high LDL; hypercholesterolaemia; all stone; triglyceridaemia; obesity; hepatitis; hepatocellular carcinoma; aromatase; cytostatic; antilipaemic; antiarteriosclerotic; anorectic; hepatotropic; litholytic; antiinflammatory; virucidal.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       oligonucleotide sequence is an antisense DNA oligo used to modulate the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Antisense DNA oligo used to modulate human LRH1 expression SegID 2634.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Gaps

This invention relates to novel antisense compounds useful for modulating the expression of liver related homologue-1 (LRH1) and splice variants thereoffically, it refers to compositions 8-30 nucleobases in clength that target a portion of an active site on the nucleic acid molecule encoding LRH1 (also known as NR5A2). LRH1 is a monomeric orphan cuclear receptor protein that functions as a tissue specific cranical factor. The present invention describes antisense componition factor. The present invention describes antisense continuage, a phosphorothoate linkage, at least one modified uncleobase, a 5-comethoxycthy1 (2' MOE) and at least one modified uncleobase, a 5-comethoxycthy1 (2' MOE) and at least one modified sugar moiety, a 2'-O-methoxycthy1 (2' MOE) and at least one modified sugar moiety. Ca 2'-O-methoxycthy1 (2' MOE) and at least one modified successivation associated with LRH1, such as beast cancer, disgnosing a disease associated with LRH1, such as beast cancer, disglosing a disease associated with LRH1, such a condition associated with aromatase activity. Accordingly, these compositions exhibit contining an antilippendic, antiliarensions continual activities. This cycostatic, antilipenmatory and virucidal activities. This colisonucleotide sequence is an antisense DNA oligo used to modulate the expression of the human LRH1 protein of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ö

New antisense oligonucleotides targeted to a nucleic acid encoding liver related homologue-1 (LRH1), useful for treating breast cancer, dyslipidemia, atherosclerosis, hypercholesterolemia, or hepatitis.

Example 15; SEQ ID NO 2516; 909pp; English.

This invention relates to novel antisense compounds useful for modulating the expression of liver related homologue-1 (LRH1) and splice variants thereof. Specifically, it refers to compositions 8-30 nucleobases in clength that target a portion of an active site on the nucleic acid molecule encoding LRH1 (also known as NRSA2). LRH1 is a monomeric orphan nucleuse receptor protein that functions as a tissue specific or transcription factor. The present invention describes antisense coligonucleotides that comprise at least one modified sugar moiety, a 2'-O-methoxyethyl (2' MDE) and at least one modified sugar moiety, a 2'-O-methoxyethyl (2' MDE) and at least one modified sugar moiety, a 2'-O-methoxyethyl (2' MDE) and at least one modified sugar moiety, a chaspenborothioate linkage, at least one modified sugar moiety, a 1'-O-methoxyethyl (2' MDE) and at least one modified sugar moiety, a 2'-O-methoxyethyl (2' MDE) and at least one modified sugar moiety, a 3'-O-methoxyethyl (2' MDE) and at least one modified sugar moiety, dispansing a disease associated with LRH1, such as becast cancer, dispansion, in proportion, and a sensoriated with LRH1, such as becast cancer, chaptitis as well as hepatocellular carcinoma or a condition associated with aromatase activity. Accordingly, these compositions exhibit with aromatase activity. Accordingly, these compositions exhibit colliponucleotide sequence is an antisense DNA oligo used to modulate the correspondence.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     New antisense oligonuclectide for modulating endothelial lipase expression, for diagnosing, preventing or treating e.g. dyslipidemia, low high density lipoprotein or cardiovascular disorders.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                /mcd_base= OTHER
/note= "This oligonucleotide has a phosphorothioate
/note= "This oligonucleotide has a phosphorothioate
backbone and 2-"methyoxethyl (2'-MOE) wings at the 5'
and 3' ends, which are 4 nucleotides in length. Also all
cytidine residues are 5-methylcytidines"
                                                                                                                                                                                                                                                                                                     Antilipaemic; Cardiovascular; Analgesic; Antianginal; Antisense therapy; Human; Endothelial Lipase; dyslipidaemia; high density lipoprotein; HDL; cardiovascular disorder; metabolic syndrome X; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The present invention relates to antisense oligonucleotides (ADJ21603-ADJ25510) targeted to human Endothelial Lipase (EL) coding sequence (ADJ25517), where the antisense oligonucleotide specifically hybridises with and inhibits the expression of EL. The antisense oligonucleotides are useful for anoulating the expression of endothelial lipase in cells or tissues to treat diseases associated with EL expression, such as dyslipidaemia, low high density lipoprotein (HDL), cardiovascular disorder or metabolic syndrome X. In addition, the oligonucleotides are
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Gaps
                                 Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         disorder or metabolic syndrome A. In addition, one cassimiter used for diagnostics, prophylaxis, or as research reagents or kits.
                                                                                                                                                                                                                                                                      Human endothelial lipase antisense oligonucleotide, SEQ ID 2517.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ö

Also all cytidine residues are 5-methylcytidines"
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The present invention relates to antisense oligonucleotides (ADJ21603-ADJ25510) targeted to human Endothelial Lipase (EL) coding sequence (ADJ25511), where the antisense oligonucleotide specifically hybridises with and inhibits the expression of EL. The antisense oligonucleotides are useful for modulating the expression of endothelial lipase in cells or tissues to treat diseases associated with EL expression, such as dyslipidaemia, low high density lipoprotein (HDL), cardiovascular disorder or metabolic syndrome X. In addition, the oligonucleotides are used for diagnostics, prophylaxis, or as research reagents or kits.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The present invention relates to antisense oligonucleotides (ADJ21603-ADJ25510) targeted to human Endothelial Lipase (EL) coding sequence (ADJ25511), where the antisense oligonucleotide specifically hybridises with and inhibits the expression of EL. The antisense oligonucleotides are useful for modulating the expression of endothelial lipase in cells or tissues to treat diseases associated with EL expression, such as dyslipidaemia, low high density lipoprotein (HDL), cardiovascular disorder or metabolic syndrome X. In addition, the oligonucleotides are used for diagnostics, prophylaxis, or as research reagents or kits.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Gape
Human endothelial lipase antisense oligonucleotide, SEQ ID 2518
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  1.3%; Score 14.2; DB 1; Length 20; 84.2%; Pred. The present invention relates to an antisense compound targeted to a nucleic acid molecule encoding Nav1.3, where the antisense compound and composition are useful for treating a disease or condition compound and composition are useful for treating a disease or condition associated with Nav1.3, e.g. pain including but not limited to neuropathic pain, post-herpetic neuralgia, chronic pain, lower back pain, clabelic neuropathy, trigeminal neuropathy, arthritic pain, acute pain, pain from burns, migraine headache, cluster headache, mild-to-moderate headache; seizure disorder such as childhood seizure disorder, including but not limited to neonatal or infantile epilepsy; or ataxia. The present sequence represents a chimeric phosphorothicate oligonucleotide with 2 MoDE wings and a deoxy gap. Used during the antisense inhibition of human Nav1.3 expression, the oligonucleotides are designed to target different regions of the human Nav1.3 RNA.
                                                                                                                                                                                                                                                                     New antisense compound targeted to a nucleic acid molecule encoding Navl.3, useful for useful for treating a disease or condition associated with Navl.3, e.g. pain, seizure disorder such as childhood seizure disorder, or ataxia.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Osteopathic; calvarial osteoblast differentiation; osteoblast differentiation; calvarial osteoblast mineralization; calvarial osteoblast mineralization; NBLL-1; bone fracture repair; bone density;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ADL97965/
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Š
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  g
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The present invention relates to an antisense compound targeted to a nucleic acid molecule encoding Nav1.3, where the antisense compound and compositions with and inhibits the expression of Nav1.3. The compound and composition are useful for treating a disease or condition associated with Nav1.3, e.g. pain including but not limited to neuropathic pain, post-herpetic neuralgia, chronic pain, lower back pain, diabetic neuropathy, trigeminal neuropathy, arthritic pain, lower back pain, can from burns, migraine headache, cluster headache, mild-to-moderate headache; seizure disorder such as childhood seizure disorder, including but not limited to neonatal or infantile epilepsy; or ataxia. The present sequence represents a chimeric phosphorchhoad pain, sequence represents a chimeric phosphorchhoad eligencelectide with 2. WMOE wings and a deoxy gap. Used during the antisense inhibition of human Nav1.3 expression, the oligonucleotides are designed to target
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             New antisense compound targeted to a nucleic acid molecule encoding Navl.3, useful for useful for treating a disease or condition associated with Navl.3, e.g. pain, seizure disorder such as childhood seizure disorder, or ataxia.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Navl.3; Analgesic; Nootropic; Neuroprotective; post-herpetic neuralgia; diabetic neuropathy; arthritic pain; migraine headache; infantile epilepsy; ataxia; ss.

The present invention relates to a method for modulating calvarial osteoblast differentiation and mineralization. The method comprises altering expression or activity of NELL-1, where the increased expression or activity of NELL-1 increases osteoblast differentiation or mineralization and decreased expression or activity of NELL-1 decreases osteoblast differentiation or mineralization. The methods and NELL-1 gene are useful for facilitating repair of bone fractures and/or to generally increase bone density. The present sequence is a PCR primer, used to

The invention relates to oligonuclectides anti-sense to an initiation codon, coding region, 5' or 3' intron-exon junction, intron or region with 2-10 nuclectides of the 5'-end or 3'-end of a nucleic acid target chosen from a gene encoding interleukin (IL)-4 receptor, interleukin (IL) consen from a gene encoding interleukin (IL)-4 receptor, interleukin (IL) consent from a gene encoding interleukin (IL)-4 receptor, interleukin (IL) consent from a gene encoding interleukin (IL)-4 receptor, interleukin (IL) consent from the consent from and/or treatment of a respiratory or lung disease. The prevention and/or treatment of a respiratory or lung disease. The consent from Encoding interleukin-4 receptor, interleukin-5 receptor, consecut from Tryptase b, PDE4 B, PDE4 C, or PDE4 D. The oligonuclectides are useful for receptor, interleukin-5 receptor, capiratory or lung disease is associated with hyper-responsiveness to and/or increased levels of, adenosine and/or lung disease. The creeptor (S), and/or asthma and/or lung allergie associated with cinflammation or an inflammation, allergy, asthma, impeded respiration, cystic fibrosis (CP), chronic obstructive pulmonary disease (COPD), allergic rhinitis, acute respiratory distress syndrome, pulmonary chypertension, lung inflammation, distress syndrome, pulmonary chypertension, lung inflammation, allergy, asthma, an oligonucleotide of the pronchoonstriction. This sequence represents an oligonucleotide of the ô Novel single or multiple target oligonucleotide anti-sense to e.g. initiation codon, intron of respiratory disease-relevant gene e.g. CCR1, RANTES, MCP4, useful for prophylaxis or treating respiratory disease e.g. CCRI; CCR3; Eccaxin-1; RANTES; MCP4; CD23; ICAM; VCAM; tryptess a; tryptess b; PDB4 A; PDB4 C; PDB4 D; respiratory disease; lung disease; hyper-responsiveness; adenosine; adenosine A receptor; asthma; lung allergy; inflammation; inflammatory disease; airway inflammation; allergy; impeded respiration; cystic fibrosis; CF; chronic obstructive pulmonary disease; COD9; allergic rhinitis; acute respiratory distress syndrome; pulmonary hypertension; lung inflammation; bronchitis; airway obstruction; bronchoconstriction. 88; interleukin-4 receptor; IL-4; interleukin-5 receptor; IL-5; Gaps .; 0 1.3%; Score 14.2; DB 1; Length 20; 84.2%; Pred.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     RESULT 342
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Matches
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ADP68640/
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ઠ
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   셤
                                                                                                                                                                                                                                                                                                                                                                                                  The invention relates to oligonuclectides anti-sense to an initiation codon, coding region, 5' or 3' intron-exon junction, intron or region with 2-10 nuclectides of the 5'-end or 3'-end of a nucleic acid target chosen from a gene encoding interleukin (IL)-4 receptor, interleukin (IL)-5 receptor, CCRI, CCR3, Ectaxin-1, RANTES, MCP4, CD23, ICAM, VCAM, CTAPA repase a, tryptase b, PDE4 A, PDE4 B, PDE4 C or PDE4 D. The invention also relates to a method of screening a candidate compound that binds to one or more nucleic acid target(s) or expressed product(s), for the prevention and/or treatment of a respiratory or lung disease. The oligonuclectides are useful for reducing or inhibiting expression of a cene or mRNA encoding interleukin-4 receptor, interleukin-5 receptor, CCR1, CCR3, Eotaxin-1, RANTES, MCP4, CD23, ICAM, VCAM, tryptase a, tryptase b, PDE4 B, PDE4 C, or PDE4 D. The oligonuclectides are useful for preventing a respiratory or lung disease. The respiratory or lung disease is associated with hyper-responsiveness to and/or increased levels of, adenosine and/or levels of adenosine A inflammation or asthma and/or levels of adenosine A inflammation or an inflammation, allergy, asthma, impeded respiration, alleric fibrosis (FF), chronic obstructive pulmonary disease (COPD), allered and an inflammation, allergy, asthma, impeded respiration, alleric fibrosis (FF), chronic obstructive pulmonary disease (COPD), allered and an inflammation, allered such an entermination or allergy asthma, impeded respiration, allered such and an entermination or allergy, asthma, impeded respiration, allered such and an entermination or allergy asthma, impeded respiration, allered such and an entermination or allergy asthma, impeded respiration, allered such and an entermination, allered such and an entermination of allered such and an entermination, allered such and and an entermination and and and an entermination and and an ente

The present invention relates to diagnosing or monitoring transplant crejection, e.g. cardiac or kidney transplant rejection, in an individual comprises detecting the expression level of one or more genes. The methods system and kits are useful in diagnosing or monitoring transplant rejection, e.g. heart, kidney, liver, pancreas, pancreatic islet, lung, bone marrow or stem cell transplant rejection, in an xenotransplant rejection or mechanical organ replacement rejection, in an individual. The methods are also useful in assessing the immune status of an individual. The methods are also useful in diagnosing and monitoring diseases that involve the immune system, e.g. rheumatorid arthritis, or ultra, bacterial or fungal infection. The present sequence represents a probe for a 50 mer oligonaleotide marker for diagnosis and monitoring of allograft rejection and other disorders.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Diagnosing or monitoring transplant rejection, e.g. heart, kidney, liver, pancreas, pancreatic islet, lung, bone marrow or stem cell transplant rejection, in an individual, comprises detecting the expression level of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   cytostatic; gene therapy; PPAR-alpha; peroxisome proliferator-activated receptor-alpha; PPAR-alpha modulator; PPAR-alpha associated disorder; hyperproliferative disorder; human; antisense oligonucleotide; antisense technology; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Gaps

                                                                                                                                                                                                The invention describes a compound, having a sequence comprising 8-80 bp targeted to a nucleic acid encoding PPAR-alpha (peroxisome proliferator-activated receptor-alpha), that specifically hypridises with the nucleic acid encoding PPAR-alpha comprising 86001-bp sequence and inhibits expression of PPAR-alpha comprising 86001-bp sequence and inhibiting the expression of PPAR-alpha. Also described are: a method of inhibiting the modulator of PPAR-alpha in cells or tissues; a method of screening for a modulator of PPAR-alpha; a diagnostic method for identifying a disease state; a kit or assay device comprising the compound; and a method of treating an animal having a disease or condition associated with PPAR-alpha. The oligonuclectide compound is useful for preparing a composition for treating hyperproliferative disorder e.g. cancer. This sequence represents a human peroxisome proliferator-activated receptor-alpha (PPAR-alpha) antisense oligonuclectide.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ss; primer; single nucleotide polymorphism; SNP; diagnosis; disease association; linkage analysis; autoimmune disease; rheumatoid arthritis; diabetes; multiple sclerosis; systemic lupus erythematosus; inflammatory bowel disease; psoriasis; thyroditis; celiac disease; pernicious anaemia; asthma; vitiligo; glomerulonephritis; Graves' disease; myocarditis; Sjogren disease; primary systemic vasculitis; genotyping; gene therapy; PCR primer.
                                                                                                                         New oligonucleotide compound that inhibits expression of PPAR-alpha, useful for preparing a composition for treating hyperproliferative disorders, e.g. cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                  ö

The invention relates to an isolated nucleic acid molecule comprising at least 8 contiguous nucleotides where one of the nucleotides is a single nucleotide polymorphism (SNP) selected from any one of the nucleotide enclocitied polymorphism (SNP) selected from any one of the nucleotide concleotide polymorphism (SNP) selected from any one of the nucleotide caguences of SEQ ID NOS:1-669 and 1339-49582, or their complements. The SNPs are useful for identifying an increased or decreased risk for developing an individual who is at an increased or decreased risk for developing an altiphe selectes, systemic lupus erythematosus, inflammatory bowel diseases, psoriasis, thyroiditis, celiac disease, pernicious anaemia, multiphe selectes, systemic lupus erythematosus, inflammatory bowel disease, psoriasis, thyroiditis, celiac disease, pernicious anaemia, altifilgo, glomerulonephritis, Graves disease, myocarditis, cathem, vitiligo, glomerulonephritis, creliac disease, pernicious anaemia, system information for the prevention and/or treatment of the autoimmune disease particularly rheumatoid arthritis, and for the autoimmune diseases particularly rheumatoid arthritis, and for the autoimmune diseases particularly rheumatoid arthritis, and for the autoimmune diseases defined above. The NNPs are useful for human creating the diseases defined above. The nucleic acid molecules are useful for constructing the call expressing a part or all of the useful for constructing or screening drugs that modaled and stand encleic acid molecules and variant peptides, for constructing transgenic animals, for assaying or screening drugs that modaled and stated as hybridises to the nucleic acide of the invention to amplify the SNP containing region. Note SEQ ID NOS 1-49582 are claimed and stated as the printed apecification, however these sequences are not provided in the printed apecification).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Human; high bone mass; Zmax1; ss; primer; HBM; osteoporosis; osteopathic; LDL receptor; bone development; metabolic bone disease; PCR.
                                                                                                                                                      New single nucleotide polymorphisms (SNPs) associated with rheumatoid arthritis (RA), useful in identification of individuals at risk of developing RA or other autoimmune disease, and in development of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Gaps

The invention relates to an isolated amino acid protein sequence selected from an amino acid sequence appearing as ADR16922 or an amino acid sequence appearing of consisting of the extracellular domain of sequence computating or consisting of the extracellular domain of mass) allele of consisting of the extracellular domain of consisting of the extracellular domain of consisting of the extracellular domain of consisting of consisting of consisting of consisting of consisting of consisting mass of consisting consisting extractions, methods of developing pharmaceutical compositions, methods of identifying molecules involved in bone development, and methods of diagnosting and treating diseases and the high bone mass (HBM) allele on chromosome 11q13.3 encoding and the high bone mass (HBM) allele on chromosome 11q13.3 encoding and the high bone mass (HBM) allele on chromosome 11q13.3 encoding and the high connormal and abnormal conditions of bone, including metabolic bone diseases, e.g. osteoporosis. The present sequence is a PCR primer used in the mapping of the Zmaxl/HBM gene.
                                                                                                                                                                                                                            New high bone mass gene of chromosome 1.1013.3, encoding protein useful for treating, diagnosing, preventing, or screening for normal and abnormal conditions of bone, including metabolic bone diseases, e.g.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 1.3%; Score 14.2; DB 1; Length 20; 84.2%; Pred.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The invention relates to an isolated nucleic acid sequence encoding a high bone mass protein (HBM). The gene exists in two alleles, Zmax1, the notional wild-type (the cDNA for which appears as ADR47570 encoding ADR47571 and the HBM allele (the cDNA for which appears as ADR47571 encoding ADR47573). The two alleles differ by a single nucleotide polymorphism (G tor at position 582 of ADR47570) causing a Gly to Val change at position 171 of the protein. Also included are a replicative
                                                                                                                              The invention relates to a novel polynucleotide having a mutation in the codon encoding a glutamine residue present at the 126 position of a 655 amino acid sequence. The polynucleotide of the invention may be useful for the estimation or diagnosis of a condition which is associated with abnormal drug absorption and in which the ABCG2 (ATP-binding cassette gene) protein is associated. The current sequence is that of a PCR primr which was used to amplify the human ABCG2 DNA of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      New nucleic acid sequence encoding high bone mass, useful in diagnosing,

artificial chromosome comprising HBM/Zmax1 sequence (appearing as ADR47574-ADR47580), a method for amplifying a nuclectide polymorphism in the Zmax1 or HBM gene, a method for identifying a regulatory element of a HBM gene and an isolated nucleic acid segment of at least 15 contiguous nucleotides including a polymorphic site from HBM/Zmax1. The nucleic acid molecule and the encoded polymeptide, composition, and methods are useful in diagnosing, treating and preventing a bone development disorder, i.e. osteoporosis. The gene for HBM/Zmax1 is located on chromosome 11q13.i. The present sequence is a primer used in the mapping of the HBM/Zmax1 cloning vector comprising HBM/Zmax1 (and a replicon operative in an isolated host cell), an expression vector comprising HBM/Zmax1 operably linked to a transcription regulatory region, an isolated host cell transformed with the vector(8), a method for testing a substance as a therapeutic agent for bone modulation in a host, a method of identifying a molecule involved in bone modulation, a method for identifying a (candidate) protein involved in bone modulation, a method of testing for HBM activity, a method of developing a pharmaceutical for the treatment of bone development disorders, a method for treating a bone development method for diagnostic assay for bone development disorder, a diagnostic assay for bone development disorder, a diagnostic assay for bone development disorders, a method for a pone development disorder, a method for dispnostic assay for bone development disorders, a method of expressing the HBM protein in bone tissue, a bacterial Sequence 20 BP; 4 A; 3 C; 7 G; 6 T; 0 U; 0 Other;

```
The present invention relates to a leptin receptor related protein (OB-RGRP) antisense oligonucleotide (ON; ADR27653), that hybridises specifically with and inhibits the expression of ADR27652. The ON promotes expression of leptin receptors on the cell surface and may contain phosphorothioate bonds; 2'-O-methyl nucleotides and/or a criethyleneglycol residue at the 3'-end; Also claimed are interfering RNA triethyleneglycol residue at the 3'-end; Also claimed are interfering RNA (IRNA) of 15-25 in that hybridize specifically with ADR27672, and inhibit expression of OB-RGRP. Also claimed are fusion proteins (FPS) and their expression of OB-RGRP. Also claimed are fusion proteins (FPS) and their coding sequences comprising OB-RGRP or MY047 (thought to be a member of the OB-RGRP family, shares 68% homology with OB-RGRP), and a protein that is a donor or acceptor of energy e.g. luciferase or yellow fluorescent protein (YFP) for detecting compounds that modify the interaction between the leptin receptor and OB-RGRP proteins, which can be used to prevent or treat leptin-related disorders. ON, also related interfering RNA, are treat leptin-related disorders. ON, also related disorders, e.g. used for prevention and/or treatment of leptin-related disorders, e.g. calcification; obesity, diabetes; anoroxia; disorders of sexual maturity, haematopoiesis, angiogenesis, thrombus formation, regulation of immunity and inflammation, fetal development and cancer. The present sequence is a RT-PCR primer used to illustrate the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ö

The present sequence represents a preferred target sequence for an enzymatic nucleic acid (i.e. a ribozyme) which cleaves interleukin-5 (IL-5) mRNA at the nucleotide base position indicated in the DB line. Regions of the mRNA that do not form secondary folding structures and that contain potential hammerhead and hairpin ribozyme cleavage sites were identified by computer analysis. Ribozymes directed against these mRNA sequences were designed and synthesised with modifications that improve their nuclease resistance. The ribozymes cleave the IL-5 target sequences and thereby inhibit IL-5 expression, making them useful for treating chronic asthma, e.g. by inhibiting the synthesis of IL-5 in lymphocytes and preventing the recruitment and activation of eosinophils. The ribozymes can allo be used to treat cosinophils (related to parasitic infection or with pulmonary infiltration) and L-tryptophan-associated eosinophilia-myalgia syndrome. The present sequence represents the preferred target sequence of an enzymatic nucleic acid, especially a hammerhead ribozyme, which cleaves can be the patieits of virus (HCV) RNA sequence at the base position given in the descriptor line. The HCV sequence was screened for optimal ribozyme target sites using a computer folding algorithm and regions of the mRNA which did not form secondary folding structures and contained potential cibozyme cleavage sites were identified. Ribozymes were synthedised to target these sites and their activities optimised by either varying the carget these sites and their activities optimised by either varying the carget the binding arms or by modification to prevent degradation by nucleases. The ribozymes of the invention inhibit gene expression and/or viral replication, and are used to treat diseases associated with Hepatitis C virus (HCV) infection, e.g. cirrhosis, liver failure and hepatocellular carcinoma. The ribozymes may be used in combination with interferon to treat HCV infection, other infectious diseases, autoimmune
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Enzymatic nucleic acid, RNA cleavage, Hepatitis C virus infection; HCV ribozyme; HCV expression, HCV replication, cirrhosis; virucide; liver failure, hepatocellular carcinoma; HCV infection; drug therapy; type I interferon; interferon alpha; interferon beta; cytostatic; interferon gamma; consensus interferon; hepatotropic; antiinflammatory; substrate; hammerhead ribozyme; HH ribozyme; 88.
                                                                                                                                                                                                                                                                                                                                                                                                Novel ribozymes for the treatment of diseases and conditions related to
cirrhosis; liver failure; hepatocellular carcinoma; interferon; cancer;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       셤
                                                                                                                                                                                                                                                                                The present invention relates to enzymatic nucleic acids which specifically cleave RNA derived from Hepatitis C virus (HCV). The enzymatic nucleic acid or ribozyme is in a harmerhead (HH) or hairpin (HP) motif where the binding arms comprise sequences complementary to one of the substrate sequences defined in the specification. The HCV intozymes are useful for modulating the expression and/or replication of HCV. They can be used to treat cirrhosis, liver fallure and/or replication of hepatocellular carcinoma. The HCV infection in conjunction with one or more a condition associated with HCV infection in conjunction with one or more conterted rung therapies, particularly type I interferon. The present sequence represents a substrate for a HCV harmerhead (HH) ribozyme. Note: Some of the sequence data for this patent did not form part of the printed specification. The complete sequence data for this patent was obtained in electronic format directly from the USPTO web site at
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Cytostatic; virucide; neuroprotective; nootropic; neuroleptic; gene chip; antisense; sense; tumour; cell degeneration; cancer; Alzheimer's disease; schizophrenia; protein chip; gene therapy; tumour suppression; human fukutin; ds.
                                                                                                                                                                                                              New ribozymes targeting RNA derived from hepatitis C virus inhibit viral replication and are useful to treat hepatitis C virus infections and cirrhosis, liver failure or hepatocellular carcinoma.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Gaps

The invention relates to a novel isolated 17 mer nucleic acid sequence, given in the specification, a sequence containing at least 15 consecutive nucleotides from the 17 mer sequence, a sequence with, after optimal alignment, at least 80 % identity to the 17 mer sequence, a sequence that hybridizes to them under highly stringent conditions, or the complement of any of them, or the corresponding RNA. The novel isolated nucleic of any of them, or the corresponding RNA. The novel isolated nucleic component of a gene chip, in vitro as (anti) sense reagents, and for component of a gene chip, in vitro as (anti) sense reagents, and for production of recombinant polypeptides. Any of the nucleic acids, polypeptides, vectors containing the nucleic acids, cells containing the polypeptides are useful for preparation of pharmaceuticals for prevention and/or treatment of viral diseases that are characterised by development of tumours or cell degeneration, specifically cancer but also Alatheimer's disease and schizophrenia. Analysis of the expression of the 17 mer nucleic acids in patient samples is useful for diagnosis and/or prognosis of these chips. The nucleic acid sequences of the invention can be used in gene things. The nucleic acid sequences of the invention can be used in gene things.
                                                                                                                                                                                                                                                                                                                                            New isolated nucleic acid, useful for treating viral diseases associated with tumors and cell degeneration, also related polypeptides, antibodies
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                therapy. This polynucleotide sequence represents a tumour suppression related human fukutin oligonucleotide of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Human biallelic marker upstream amplification primer SEQ ID NO:5553.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Human genome; biallelic marker; high density disequilibrium map; genomic map; haplotype; phenotype; polymorphic base; genotyping; haplotyping; hybridisation; identification; characterisation; amplification; single nucleotide polymorphism; SNP; PCR primer;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ö
                                                                                                                                                                                                                                                                                                                        AA265654 to AA269578 represent human biallelic markers from the present invention, which contain a polymorphic base at position 24 of their nucleotide sequences. AA269579 to AA27440 represent amplification primers for the biallelic markers. The biallelic markers of the invention have a variety of uses: they can be used for high density mapping of the human genome, and in complex association studies and haplotyping studies which are useful in determining the genetic basis for disease states. Compositions and methods of the invention can also be useful for the identification of the targets for the development of pharmaceutical agents and diagnostic methods, as well as the characterisation of the differential efficacious responses to and side effects from pharmaceutical agents acting on a disease as well as other treatment.

AA265654 to AA269578 represent human biallelic markers from the present invention, which contain a polymorphic base at position 24 of their nucleotide sequences. AA269579 to AA277440 represent amplification nucleotide sequences. AA269579 to AA277440 represent amplification have a variety of uses: they can be used for high density mapping of the human genome, and in complex association studies and haplotyping studies which are useful in determining the genetic basis for disease states. Compositions and methods of the invention can also be useful for the identification of the targets for the development of pharmaceutical agents and disgnostic methods, as well as the characterisation of the differential efficacious responses to and side effects from pharmaceutical agents acting on a disease as well as other treatment.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             28-OCT-1999.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       AAZ71268;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   RESULT 356
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      AAZ71268
```

ö invention, which contain a polymorphic base at position 24 of their nucleotide sequences. AAZ69579 to AAZ77440 represent amplification primers for the biallelic markers. The biallelic markers of the invention have a variety of uses: they can be used for high density mapping of the human genome, and in complex association studies and haplotyping studies which are useful in determining the genetic basis for disease states. Compositions and methods of the invention can also be useful for the identification of the targets for the development of pharmaceutical agents and diagnostic methods, as well as the characterisation of the differential efficacious responses to and side effects from pharmaceutical agents acting on a disease as well as other treatment.

N. B. The SEQ ID NOS 2852, 2913, 2974, 3035, 3056, 3157, 3227, 3297 and 3367, are not actually given a sequence in the Sequence Listing from the The invention relates to human HTREK2 polypeptides and nucleic acid molecules encoding such polypeptides. TREK2 polypeptides are useful in screening assays to identify compounds that may stimulate or inhibit their function or level of expression. Sequences of the invention are used to treat cancer, diabetes, asthma, pulmonary disease, cardiovascular diseases, inflammatory disease, renal disease, pain, psychiatric ö Human, hTREK2 protein, cancer; diabetes; pulmonary disease; asthma; cardiovascular disease; inflammatory disease; psychiatric disorder; renal disease; neurodegenerative disease; neurological disorder; Alzheimer's disease; depression; schizophrenia; stroke; vaccine; trauma; Novel human TREK2 (HTREK2) polypeptide and polynuclectide encoding it, useful for identifying agonists and antagonists in the treatment of diseases associated with a HTREK2 imbalance, such as diabetes, cancers Gaps ; 1.3%; Score 14; DB 1; Length 20; 100.0%; Pred. The inhibition of Fas mediated bignalling is thought to be immunosuppressive, antiinflammatory, hepatotropic, cytostatic and vasotropic. Antisense oligonuclectides were designed to target human Fas. Oligonuclectides were synthesised as chimmeric oligonuclectides and are useful for treating an animal having an autoimmune or inflammatory disease e.g., hepatitis, cancer, a condition associated with apoptosis, allograft rejection, or ischemia repertusion injury. Optionally, the above mentioned conditions are prevented by contacting the allograft with the antisense oligonuclectide. The oligonuclectide. The oligonuclectide. The oligonuclectides are also useful for research purposes. The present nucleotide sequence is related to
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Novel antisense compound targeted to nucleic acid encoding Fas, Fas
ligand or Fas associated protein-1 is useful for inhibiting expression of
Fas, Fas ligand, or Fap-1 in cells or tissues, and for treating

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The invention comprises antisense nucleic acids that are capable of binding to the transcription product of the gene coding for the alpha-V integrin chain, thereby inhibiting the expression of alpha-V integrins in mammalian cells. The antisense nucleic acids of the invention are useful for the treatment of pathological disorders by the modulation of cell adhesion which affects platelet aggregation, immune functions, tissue repair, cell proliferation, tumour invasion, inflammatory diseases diseases. Disorders which can be treated include: cancer; restenosis after angioplasty; stenosis to vein bypass; chronic inflammatory diseases (e.g. chron's disease and rheumatoid arthritis); ocular neovascular diseases (e.g. diabetic retinopathy); disorders associated with excessive
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            diseases (e.g. diabetic retinopathy); disorders associated with excessive bone resorption (e.g. osteoporosis); disorders dimmanalin oral cavity (e.g. gingivitis); and inflammatory skin disorders (e.g. psoriasis). The present DNA sequence represents an anticonnection.
                                                                                                                                                                                                                                                                                                                                                                                                                           Antisense nucleic acid, ss, alpha-V integrin chain, antisense inhibition, cell adhesion modulation; platelet aggregation; immune function; tissue repair; cell proliferation; tumour invasion; cancer; gingivitis; chronic inflammatory disease; Chron's disease; rheumatoid arthritis; ocular neovascular disease; diabetic retinopathy; osteoporosis; excessive bone resorption; inflammatory skin disorder; psoriasis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Antisense nucleic acid against alpha V integrin for use in pharmaceutical compositions for the specific inhibition of the expression of alpha

the predisposition of appearance or inheritance of inverted nipples, where the nucleic acid is identical to the region of microsatellites 20200, SW2443, S0097, SW1010 or S0164 on chromosomes 6, 2, 4, 14, 14 and 3, respectively, in pigs, or homologous positions in the genomes of cher mammals. The nucleic acids can be used to select pets, breeding or farm animals that lack inverted nipples, particularly by genomic screening of many related mammals in a population. The present sequence is a PCR primer used in the exemplification of the invention to identify microsatellite markers associated with the inverted nipple phenotype
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Determining predisposition to inverted nipples useful e.g. for selecting breeding animals comprises detecting specific microsatellite markers.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The present invention relates to the use of a nucleic acid to determine
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Gарв
                                                                                                                                                               Mammalian inverted nipple associated microsatellite PCR primer #82.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ò

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ö
                                                                                                                                                                                                                                                                                                                                                             The invention describes a compound 8-80 nucleobases in length targeted to, and which specifically hybridizes with a nucleic acid molecule encoding PTPN12 (protein tyrosine phosphatase, non-receptor type 12), and inhibits the expression of PTPN12. The compound, composition and methods are useful for treating a disease or condition associated with PTPN12, such as a hyperproliferative disorder, e.g. colon cancer, or a metabolic disorder. They are also useful in research and diagnostics for modulating the expression of PTPN12. This sequence represents a human protein tyrosine phosphatase, non-receptor type 12 (PTPN12) antisense oligonucleotide.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Antisense therapy; human; Fas; Fas ligand; FasL; Apo-1L; CD95L; Fas associated protein 1; Fap-1; signal transduction; autoimmune disease; inflammatory disease; cancer; immunosuppressive; antiinflammatory; cytostatic; phosphorothioate; ss.

The present invention relates to antisense compounds targeted to nucleic acids encoding human Pas (also known as Apo-1 or CD95), Fas ligand (Fast, also Apo-1L and CD951), and Fas associated protein 1 (Fap-1). The antisense compound comprises an antisense oligonucleotide that specifically hybridises with one of the said nucleic acids and inhibits Fas, Fast or Fap-1 mediated signal transduction. The antisense oligonucleotide is a chimeric oligonucleotide. The antisense oligonucleotide comprises at least one modified internucleoside linkage, preferably a phosphorothioate linkage. It also comprises at least one modified mucleoside properties and linkage. It also comprises at least one modified mucleosides, preferably a 2-O-methoxyethyl (2-MOE) sugar moiety, The antisense oligonucleotide further comprises at least one modified nucleobase, preferably a 5-methylcytosine. The antisense oligonucleotide further comprises at least one modified ancleosase, preferably a 5-methylcytosine. The antisense oligonucleotide sassociated with overexpression of constitutive activation of Fas, Fast, or Fap-1. The present sequence represents an antisense oligonucleotide used in the examples of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     immunosuppressive; antiinflammatory; hepatotropic; virucide; cytostatic; antisense technology; Fas; Fas ligand; Fap-1; Fas associated disorder; Fap-1 associated disorder; ischaemia reperfusion injury; apoptosis; allograft; autoimmune disease; inflammatory disease; hepatitis; cancer;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        New antisense oligonucleotides of 20-50 nucleobases, useful for treating autoimmune or inflammatory diseases, and cancer.
                                                                                                                 /mod_base= OTHER
/note= "This oligonucleotide has a phosphorothioate
backbone and 2'-methyoxyethyl (2'-MOE) wings at the 5'
and 3' ends, which are 5 nucleotides in length at each
end. All cytidine residues are 5-methylcytidines"
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The invention describes an antisense compound 8-30 or 8-50 nucleobases in length targeted to the 5'-untranslated region, translational start site, translational termination region or 3'-untranslated region of a nucleic acid molecule encoding Fas Igand or Fap-1. Also described are: a pharmaceutical composition comprising the anti-sense compound and a pharmaceutical carrier or diluent; a method of inhibiting the expression of Fas or Fap-1 in cells or tissues: treating an animal having a disease or condition associated with Fas or Fap-1; anda preventing allograft rejection, ischaemia reperfusion injury or apoptosis in an allograft celection, ischaemia reperfusion injury or apoptosis in an allograft celection, ischaemia reperfusion of pharmaceutical composition is useful in diagnosing, treating or preventing autoimmune or inflammancy disease, e.g. hepatitis, cancer, e.g. cancer of the colon, liver, lung or a lymphoma, apoptosis, allograft rejection, e.g. cardiac, renal, hepatic or a lymphoma pharmaceutical injury. For the selective killing of SKBR3 cells the following radiolabelled cerb-B2 oligonucleotides were used: (1) the antisense oligonucleotide given in AAQ40911, complementary to the non-transcribed sequence at the 5' end of the gene; (2) the sense oligonucleotide given in AAQ40912, complementary to the transcribed sequence at the 5' end of the gene; (3) the random sequence given in AAQ40913, having the same base compsn. as the antisense oligonucleotide. (Updated on 25-MAR-2003 to correct PN.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Cpd. comprising anti-sense oligo:nucleotide and radioactive moiety - for
treating viral infection, sepsis, leukaemia and tumours.

The present invention describes enzymatic nucleic acid molecules with RNA cleaving activity, which specifically cleave RNA encoded by an aryl hydrocarbon nuclear transporter (ARNY) gene, an integrin subunit beta 3 gene, an integrin alpha 6 subunit gene, or a Tie-2 gene. AAA16775 to AAA17167 and AAA17561 to AAA17622 represent ribozyme sequences for ARNT, and AAA1768 to AAA17685 to AAA1768 and AAA19087 to corresponding target sequences; AAA17685 to AAA18856 and AAA19087 to AAA18154 represent ribozyme sequences for Tie-2, and AAA18386 to AAA19086 and AAA19155 to AAA19222 represent their corresponding target sequences;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Novel ribozymes for modulating the synthesis, expression and/or stability of an mRNA encoding an angiogenic factors.
I, II and III genes. These primers were targetted 100 bp upstream
                                   and downstream of each gene. The amplified sequences were cloned and further amplified using the primers given in AAT05982-87. COX genes from normal individuals and patients with Alzheimer's disease were sequenced and compared. The COX subunit I and II genes were found to be mutated in patients with Alzheimer's disease (AD) and comparison between wildtype and mutations. Knowledge of these mutations allows the detection of the sporadic form of AD. Mutations within the COX I and II genes have also been found to segregate with diabetes mellitus. Oligomers which are antisense to the positions of mutations can be used in the therapy of AD.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Human; aryl hydrocarbon nuclear transport; ARNT; TIE-2; angiogenesis; integrin alpha 6 subunit; integrin subunit beta 3; hairpin ribozyme; hammerhead ribozyme; angiogenic factor; cytostatic; antidiabetic; ophthalmologic; antiinflammatory; antiarthritic; antipsoriatic; ARND; dermatological; RNA cleavage; cancer; diabetic retinopathy; arthritis; age related macular degeneration; inflammation; neovascular glaucoma; myopic degeneration; psoriasis; veruca vulgaris; angiofibroma; tuberous sclerosis; pot-wine stain; Sturge Weber syndrome; Kippel-Trenaunay-Weber syndrome; Osler-Webor-Rendu syndrome; ss.

AAA19223 to AAA20361 and AAA21501 to AAA21595 represent ribozyme sequences for integrin alpha 6 subunit, and AAA20362 to AAA2160 and AAA21689 to AAA21689 represent their corresponding target sequences.

AAA21896 to AAA21475 and AAA2342 to AAA23342 represent ribozyme sequence for integrin subunit beta 3, and AAA22476 to AAA23262, AAA23343 to AAA2342 represent ribozyme sequence for integrin subunit beta 3, and AAA22476 to AAA23262, AAA23343 to the invention are used for modulating the synthesis, expression and/or stability of an mRNA encoding angiogenic factor, especially ARNT, integrin subunit beta-3, integrin subunit alpha-6, or Tie-2. They are specially used to treat cancer, diabetic retinopathy, age related macular degeneration (ARMD), inflammation, and arthritis, as well as neovascular glaucoma, myopic degeneration, psoriasis, verrues vulgaris, syndrome, Kippel-Trenaunay-Weber syndrome, Osler-Weber-Rendu syndrome, and other syndrome, and diseases related to the levels of ARNT, Tie-2, and other syndromes and diseases related to the levels of ARNT, Tie-2,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Inhibition of the repressors removes prevents inhibition (and consequently increases expression of) genes involved in the production of exythropoietin, granulocyte colony stimulating factor protein and interferon alpha
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The present invention relates to enzymatic and antisense nucleic acid molecules that act as inhibitors of the expression of repressor genes encoding the TR2 Orphan receptor, EAR3/COUP-TF-1, the GATA transcription factor gene, IRF-2 and/or the CAATI Displacement Protein (CDP).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Enzymatic and antisense nucleic acid inhibition of repressor genes, useful for producing e.g. granulocyte colony stimulating factor protein, interferon alpha and erythropoietin.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Ribozyme; erythropoietin; granulocyte colony stimulating factor;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ö

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The present invention relates to enzymatic and antisense nucleic acid molecules that act as inhibitors of the expression of repressor genes encoding the TR2 Orphan receptor, EAR3/COUP-TF-1, the GATA transcription factor gene, IRR-2 and/or the CAATT Displacement Protein (CDP). Inhibition of the repressors removes prevents inhibition (and consequently increases expression of) genes involved in the production of erythropoietin, granulocyte colony stimulating factor protein and interferon alpha
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Enzymatic and antisense nucleic acid inhibition of repressor genes, useful for producing e.g. granulocyte colony stimulating factor protein, interferon alpha and erythropoietin.

Nucleic acid molecules, e.g., enzymatic nucleic acids and antisense constructs, which down regulate expression of a CD20 gene or neurite growth inhibitor gene useful for treating, e.g., lymphoma, leukemia, and central nervous system injury

Claim 88; Page 136; 200pp; English.

The invention relates to a nucleic acid molecule which down regulates expression of a CD20 gene and a nucleic acid molecule which down regulates expression of a neurite growth inhibitor gene (NGGO). The nucleic acids may be enzymatic nucleic acids (e.g. a ribozyme or a nucleic acids may be enzymatic nucleic acid cleaving an RNA molecule DNAzyme) an Inozyme (an endolytic nucleic acid cleaving an RNA molecule possessing an NCH motif), a G-cleaver (cleaving RNA with a NYN motif) proposessing an NCH motif). The CD20-targetting nucleic acid is used to cleave RNA of CD20 in the presence of a divalent cation that is preferably Mg^2+. The CD20-targetting nucleic acid is used to cleave CC therapies. In particular, the CD20 targetting nucleic acid may be used to treat lymphoma, leukaemia, B-cell lymphoma, low-grade or follicular non-creat lymphoma, leukaemia, B-cell lymphoma, low-grade or follicular non-creat lymphoma, leukaemia, B-cell lymphoma, low-grade or follicular non-creat lymphoma (MCL), immunocytoma (IMC), small B-cell lymphocytic lymphoma, low-grade or follicular non-created may be contacted with a cell to reduce NOGO gene in the presence of a divalent cation that is preferably Mg^2+. Furthermore, the createring nucleic acid may be contacted with a cell to reduce NOGO activity of the creating nucleic acid may be contacted with a cell to reduce NOGO activity of the concleic acid may be contacted with a cell to reduce NOGO activity of the concleic acid may be contacted with a cell to reduce NOGO activity of the concleic acid may be contacted with a cell to reduce NOGO activity of the concleic acid may be contacted with a cell to reduce NOGO activity of the concleic acid may be contacted with a cell to reduce NOGO activity of the concleic acid may be contacted with a cell to reduce NOGO activity of the concleic acid may be contacted with a cell to reduce NOGO activity of the concleic acid may become of a gease, activity and cerebrovascular accident comprise at axia, multiple aclerosis (MS). Parkinson's disease, mu

The method involves contacting mitochondria with a conjugate molecule comprising a targeting molecule conjugate to a toxin, where the conjugate or targeting molecule accumulates in the mitochondria. The method is useful for diagnosis of Alzheimer's disease (AD), especially sporadic AD. The present sequence is a PCR primer used in the method of the present invention

                                                                                                                                                                                                                                                                                                                                                                                                      ö
                                                                                                                                                                                                                                                                            The present invention relates to a method for selectively accumulating a mitochondrial disabling or destructive amount of a conjugate molecule in mitochondria having defective cytochrome C oxidase (COX) activity or displaying increased membrane potential. The method involves contacting mitochondria with a conjugate molecule comprising a targeting molecule accomjugated to a toxin, where the conjugate or targeting molecule socingated to a toxin, where the conjugate or targeting molecule accumulates in the mitochondria. The method is useful for diagnosis of Alzheimer's disease (AD), especially sporadic AD. The present sequence is a PCR primer used in the method of the present invention

The present invention relates to a method for selectively accumulating a mitochondrial disabling or destructive amount of a conjugate molecule in mitochondria having defective oyrochrome C oxidase (COX) activity or displaying increased membrane potential. The method involves contacting mitochondria with a conjugate molecule comprising a targeting molecule conjugated to a toxin, where the conjugate or targeting molecule selected accumulates in the mitochondria. The method is useful for diagnosis of Alzheimer's disease (AD), especially sporadic AD. The present sequence is a PCR primer used in the method of the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Mitochondria; cytochrome C oxidase; COX; Alzheimer's disease; PCR primer;
                                                                                                                                                                                                                                                 Targeting conjugate molecule to mitochondria having defective cytochrome C oxidase activity for diagnosing Alzheimer's disease, involves contacting mitochondria with a conjugate of targeting molecule and toxin.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Targeting conjugate molecule to mitochondria having defective cytochrome C oxidase activity for diagnosing Alzheimer's disease, involves contacting mitochondria with a conjugate of targeting molecule and toxin.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The present invention relates to a method for selectively accumulating a mitochondrial disabling or destructive amount of a conjugate molecule in
